

Netmask Ordering

If round robin is enabled, when a client requests name resolution, the first address entered in the database is returned to the resolver, and it is then sent to the end of the list. The next time a client attempts to resolve the name, the DNS server returns the second name in the database (which is now the first name) and then sends it to the end of the list, and so on. Round robin is enabled by default.

Netmask ordering is a part of the round robin process. When an administrator configures netmask ordering, the DNS server will detect the subnet of the querying client. The DNS

server will then return a host address available for the same subnet. Netmask ordering is enabled through the DNS Manager console on the Advanced tab of the server Properties dialog box.
